

FresaControl & BerryControl

Intended as a replacement for aphicide applications. FresaControl controls all common species of aphid in strawberry, BerryControl is for raspberry species

How they work:

After adult parasitoids hatch, they detect any aphids and lay their eggs inside. The larvae develop within the aphid, which dies and a new generation of parasitoids emerges. Best used as a preventative strategy, tubes stay in the crop for at least 4 weeks delivering easy and fast installation.

Both products contain a range of *Aphidius* strains but also *Praon volucre*, a natural enemy of *Amphorophora idaei* and *Ericaphis fimbriata* (aka raspberry and blueberry aphids).

Benefits of use:

- No identification of aphids required
- Eliminates the need to use aphicides which are harmful to other beneficial insects and mites
- No risk of resistance development
- No pre-harvest intervals or residues
- Long lasting within a broad temperature range
- Safe for people, plants and the environment

Both products are now available through FAST.
