

# Anthopak 500

(*Anthocoris nemoralis*)  
For pear sucker control

With warmer weather pear sucker can be expected to build, so now is the time to be looking for the eggs and planning your first Anthocorid introductions

Rather than going straight in with chemical sprays, an introduction of Anthocorids to supplement natural predators ensures there are enough present to suppress pear sucker development.

This approach has proved very effective in problematic orchards and increasingly growers are adopting this method of control for long-term suppression.

### Anthopak 500 (*anthocoris nemoralis*)

1 bottle contains 500 Adults. The quantity required is 6 bottles/ha (3000 adults/ha) released at 3-week intervals i.e. **2 bottles per release/ha**, starting at budburst or just before.

The introduction and establishment of anthocorids is an easy system to follow and has been shown to work at multiple locations and under high pest pressures.

The price of Anthopak 500 has been held for 2021 at £24.50 + vat per bottle

For more information about Anthocorids, contact your advisor.
