

FAST Biodiversity cover crops and wildflowers

Top, soft, stone or vine - build a sustainable and biodiverse environment for your crop

FAST have championed the use of predatory and parasitic insects for many years. We have also pioneered many new ways to manage the soil. Whether to put life back into tired soils or creating havens for important natural insects, the use of cover crops and wildflowers have become an increasingly recognised part of farming.

We have been working with growers to create bespoke mixes that best suit their individual needs. We can design a package that encourages biodiversity within the orchard and combats your specific pest and disease problems.

With Autumn just around the corner, there will be a window of opportunity to get ahead of the game with the use of these crops. Speak to one of our advisors to plan for an Autumn or Spring planting.

Advantages to your crop

- ✓ Improves soil health
- ✓ Attracts beneficials
- ✓ Stops soil erosion
- ✓ Reduces pesticides
- ✓ Sequesters carbon
- ✓ Combats soil compaction
- ✓ Increases organic matter
- ✓ Good agricultural practice
- ✓ Improves pollination
- ✓ Fixes Nitrogen
